

SUSTAIN NORTHERN RIVERS SUSTAIN ENERGY

STRATEGIC PLAN 2014-2019

**REPORT ON ACHIEVEMENTS FOR THE
2014 YEAR**

SUSTAIN NORTHERN RIVERS – SUSTAIN ENERGY

STRATEGIC PLAN 2014-2019

GOAL OF SUSTAIN ENERGY:

The Northern Rivers has a resilient and sustainable energy system

HOW WILL WE ACHIEVE THIS?

By enabling our region to reduce greenhouse gas emissions from energy systems and increase the proportion of renewable energy sources to 20% by 2020

PRINCIPLES

Generation and distribution of renewable energy, energy efficiency and demand reduction are economic and social drivers for communities, businesses and industries. These drivers will equip our communities to strengthen local economies, protect the environment and increase our adaptive capacity to deal with changes arising from climate change.

The Northern Rivers has a strong history in renewable energy, and the production of renewable energy increased by 43% between 2010 and 2013. Despite this, the Northern Rivers continues to be heavily reliant on imported coal-based energy.

Sustain Energy works to foster communities which are better equipped to deal with the changes arising from climate change

The initiative in greenhouse gas reduction is increasingly being taken by households, towns, local government and some companies. There is an opportunity for strong integrated regional responses to the necessity for transition to a low carbon economy.

SNR partners:

- Recognise the value in having diverse distributed generation technologies embedded in the distribution network, including bioenergy, solar power, co-generation and battery systems;
- Seek to build community understanding skills relating to renewable energy and energy efficient technology;
- Acknowledge that energy efficiency and demand reduction offer the greatest potential for a self-reliant energy future;
- Support the development of a renewable energy industry to generate a employment;

- Seek to attract investment to sustainable renewable energy, energy efficiency and demand reduction projects in the Northern Rivers;
- Encourage decentralised energy technologies using local resources and reducing the need for large-scale supply infrastructure;
- Support an intelligent electricity network (smart grid) to integrate the actions of generators, distributors and consumers to deliver sustainable, economic and secure electricity;
- Support sustainable building design, planning and development which reduces the need for technological solutions to create highly energy efficient and adaptive environments (e.g. solar passive, activated thermal mass, glazing, shading, insulation);
- Support community-based approaches to energy infrastructure distribution and retail, to give communities a greater level of input and control and a greater share of the benefits.

BACK GROUND INFORMATION

Nearly all electricity in the region comes from the national grid, which in NSW is nearly 90% coal-fired. The National Electricity Market and Rules favour the dominant electricity providers, TransGrid (transmission), Essential (formerly Country) Energy (distribution) and Origin Energy (retail) and encourage them to sell as much power as possible. The region's centralised energy infrastructure leads to supply vulnerabilities and limited opportunities for resilience building.

The focus of Sustain Energy in relation to generation is on renewable energy sources which are sustainable in the long term.

For renewable energy to be feasible and sustainable it is essential to address barriers to investment, challenges of renewable energy costs and the need for a strong social license for any new industry to be developed in the region.

Potential renewable sources include:

- *Solar*: potential is high compared with southern Australia, but less than in inland and northern Australia.
- *Wind*: while potential is lower on the North Coast than further west, there may be potential in some coastal locations (only mapped for Byron Shire).

- *Geothermal*: no known high temperature resource, but there is potential for shallow low temperature generation.
- *Wave/current*: potential is unknown but likely to be considerable in view of exposure to the Pacific Ocean, the narrow continental shelf, and common winter southerly swells and summer sub-cyclonic north swells.
- *Biofuels*: considerable potential from existing crops (e.g. sugarcane), processing residues, effluent from livestock transfer facilities and abattoirs and a range of other waste streams.
- *Bioenergy*: bio-mass is potentially the region's greatest unexploited energy source, and there are currently a number of developing projects in the region; these include: a 150kW steam turbine near Tweed Heads operated by BORAL, two cogeneration plants using mainly sugar bagasse & wood waste producing 68mW of electricity owned by Capital Dynamics (Cape Byron Power) and a shell fired boiler implemented by Macadamia Processing Company to reduce energy costs. Potential bioenergy sources include agricultural outputs and bi-products, forestry waste products, food and other human-generated waste. Bioenergy should not compromise other sustainability issues such as food security (e.g. using arable land to grow biofuel instead of food crops) or regional biodiversity.
- *Micro-hydro*: there is considerable potential for smaller-scale plants utilising streamflows from the tablelands towards the coast. There is some domestic use of micro-hydro, particularly around Nimbin.

Current sustainable energy initiatives in the region include:

Households: Byron and Lismore LGAs have the highest uptakes of rooftop solar panels in rural NSW, but there is much scope for improvement. Even these LGAs have only 5% of households with PVs and the statistics for solar hot water systems are similar.

Communities: some NGOs have received funding for community projects such as the Nimbin Community Solar Farm (Nimbin Neighbourhood and Information Centre). The region is characterised by a significant number of intentional communities, which have established their own distributed energy systems separate from the main power grid. There is a growing interest in community investment and co-generation projects, such as the proposed Lismore Solar Farm Project.

Public authorities: Councils in the *Cities for Climate Protection* project committed to a 20% reduction in corporate and community emissions by 2012. Others have longer-term climate change strategies — e.g. Byron Council is committed to a 20% reduction in Council emissions by 2020 and Lismore City Council has made a commitment to a 100% renewable energy target for Council electricity use. Most Councils have started to measure their own emissions. Some Councils (e.g. Coffs Harbour) and public authorities (e.g. Lismore Base Hospital) have taken advantage of grants for renewable energy and energy efficiency installations. Others have

introduced energy savings plans including changing streetlights to LEDs. Ballina Shire Council is committed to construct a 4000sqm slow-pyrolysis processing plant at Ballina's Waste Facility, which will process a large proportion of the region's wood waste, biosolids and municipal organic waste. The facility is supported by a Federal Government grant and is expected to be operational by 2015. Tweed Shire Council has established a small landfill waste energy plant and have also set up a Solar Community scheme. Byron Bay and Clarence Valley Councils have constructed landfill gas extraction & flaring systems at their land fill sites to reduce CO2 emissions.

Private sector: Cogeneration plants at the Condong and Broadwater sugar mills with capacity to generate a combined 68mw of electricity were purchased in 2013 by Swiss based company Capital Dynamics. The plants, which cost to construct, are not currently operating to capacity, due in part to the absence of cane trash separation plants. Other businesses in the region have benefitted from State government programs like Sustainability Advantage and Energy Saver programs. Two such businesses are Lismore Workers Club which in 2013 installed a 100kw peak power solar system after participating in the Sustainability Advantage program and Lismore's Norco Cooperative Limited which in 2013 completed a major capital investment that included new energy efficient evaporate cooling units to reduce energy consumption in their frozen storage areas. Norco undertook a subsidised energy audit under the NSW Energy Saver program.

SUSTAINABILITY PRINCIPLES FOR A REGIONAL ENERGY RESPONSE

Sustain Energy recognises the complexity of energy policies for the region and recommends the following sustainability principles to guide any future regional energy approaches:

1. Ensure inter- generational equity
2. Maintain biological diversity
3. Employ the precautionary principle, i.e. exercise caution in a context of uncertainty, particularly where this is a risk of harm
4. Ensure sustainable use of natural resources
5. Enhance social and economic wellbeing, using sound environmental and social indicators
6. Strengthen community participation and ensure social license.

VALUE FOR OTHER REGIONS

The work of Sustain Energy provides opportunities beyond the Northern Rivers by demonstrating the steps required to determine what opportunities exist for reducing greenhouse gas emissions and making the shift to a regional, low carbon economy.

STRATEGIES AND RATIONALE

Sustain Energy has prioritised the following strategies for the reasons stated below:

Strategy	Rationale
1: Reduce greenhouse gas emissions from energy use in the Northern Rivers	Reducing greenhouse gas emissions is the key to climate change mitigation. Ideally, the aim should be for a zero-emissions energy economy. All greenhouse gas issues must be considered, including CO ₂ , methane and others.
2: Increase the proportion of renewable energy to 20% by 2020	In order to increase the self-reliance of the region, and achieve a secure energy future, there is a need to significantly increase the amount of energy generated from renewable sources.
3: Reduce energy demand and increase energy efficiency	Achieving significant and sustainable emissions reduction requires an integrated and targeted program that combines demand management and efficiency strategies.
4: Facilitate local energy distribution	Small and medium scale local projects offer the greatest potential in securing a diverse regional energy economy.
5: Promote adaptation to climate change	Issues relating to climate change such as regional changes to weather patterns, higher variances in temperatures, extreme storm events etc are likely to create additional energy demand challenges. Adaptation to climate change (eg building design) will be key to reducing the impact of climate change on the region.
6: Strengthen the capacity of Sustain Energy	The greater the capacity, the more can be achieved by the group on behalf of the SNR partners.

SUSTAIN ENERGY STRATEGIC PLAN 2014-2019

Action	Strategy number /s	Tasks	Indicators/Measures	Progress	Gaps
Review, inform and align with other local, regional, state and national strategies	All	<p>Sustain Energy members scan for relevant strategies and share with other members via Teamwork PM and Sustain Energy meetings.</p> <p>Sustain Energy Working Group, acting as a referral point, will work to inform member agencies and stakeholders on impacts of proposed new and updated strategies, policies and plans which are relevant to SNR</p> <p>Establish and maintain an up to date list of relevant strategies on Sustain Energy's webpage (or link to an existing list</p>	<p>Teamwork PM messages and links</p> <p>Standing agenda item in working group meetings and progress reported in minutes</p> <p>Contributions to submissions prepared and recorded in Teamwork PM</p> <p>Relevant submissions are stored in Teamwork PM</p> <p>Updated list of strategies maintained on or linked from Sustain Energy's webpage</p>	<p>Local government SNR members participated in the Integrated Regional Vulnerability Assessment forum led by OEH.</p> <p>Other relevant plans: OEH, RDA NR.</p> <p>Submission dated Feb 2014: to the Federal Government's Energy White paper – Issues paper</p> <p>Webpage under development – progress to date includes training undertaken, platform revised.</p>
